SOFTBOT

Transforming Warehouse Automation
Enhancing Usability with SOFTBOT Designer

Overview

In the rapidly evolving field of warehouse automation, the ability to build efficient, customizable, and scalable solutions is critical for success. SOFTBOT was brought in to enhance the usability and user experience of its flagship product, the SOFTBOT Designer. A tool dedicated to developing software robots for automating warehouse tasks. Our goal was to refine the platform's interface and workflows, making it more intuitive and enabling companies to leverage robotic technology quicker in warehouse settings. reducing time to value and improving adaptability.

This case study explores the challenges, research insights, and user-centered design enhancements that transformed the SOFTBOT Designer into a platform that empowers users while driving business growth.

The Challenge

Breaking Barriers to Usability

The SOFTBOT Designer faced significant usability challenges that hindered its adoption and efficiency. Users experienced pain points ranging from debugging inefficiencies to complex task specifications. Additionally, prior to the team's join, the Designer user base was severely limited, blocking the platform's true potential and scalability. Specific issues included:

- Constant switching between execution logs and the action canvas.
- Frequent accidental deletions during editing workflows.
- Difficulty in formatting inputs and outputs correctly.
- Execution logs displaying irrelevant information and poorly labeled errors.
- Extreme user frustration requiring excessive scrolling to view code.

These challenges translated to delays, frustration, and a steep learning curve, jeopardizing the platform's mission to enable rapid automation at scale.

Project Background and Scope

Leading the Foundation for Usability Improvements

SOFTBOT's environment is robust, no-code platform that would empower users to quickly design and deploy automation solutions. This initiative encompassed:

- Gathering qualitative and quantitative feedback from key stakeholders.
- Pinning the target audience to warehouse automation professionals.
- Conducting design audits to evaluate existing workflows.
- Crafting a roadmap to guide UX improvements from April to September 2022.

My Role and Responsibilities

Leading the Front and Driving User Research

As a key team member, I was responsible for leading user research efforts to uncover pain points and opportunities for improvement. This included:

- Conducting interviews with users to gather actionable insights.
- Synthesizing feedback to define the target user base, shifting from a broad to a more focused demographic.
- Collaborating with cross-functional teams to develop and validate design solutions.
- Overseeing the creation of prototypes and testing iterations to ensure usability and efficiency.

Our Primary Objectives

To address these challenges, the project centered around three primary objectives:

01 **Optimize Usability:** Streamline debugging and workflow creation processes.

02 **Refine Target Audience:** Shift focus to high-impact users in warehouse automation professionals.

03 **Boost Scalability:** Enable users to build more SOFTBOTs in less time, enhancing deployment speed.

Discovery and Research

Design Audit

Evaluating the Current State

A comprehensive design audit identified key usability issues and areas for improvement in the SOFTBOT Designer. The audit focused on:

- **Navigation** Users struggled with inconsistent navigation patterns, leading to confusion.
- **Execution Logs** Poorly labeled logs and irrelevant data caused confusion.
- **Editor Interface** Narrow panel blocks and excessive scrolling impeded productivity.
- **Specifications** Wireframed specs across shared procedures created workflow bottlenecks.

UX Research

Unveiling the User Experience

The UX research process aimed to answer critical questions about user behavior and platform effectiveness. Insights from the research revealed:

These findings highlighted the need for a cohesive design strategy to address user pain points and unlock the platform's potential.

UX Feedback Highlights and Themes

Listening to Our Users

User feedback revealed recurring themes that guided the design process.

	Direct quotes from users
01 **Testing & Debugging** Users found debugging tedious due to constant switching between logs and workflows.	"Able to turn up-votes through connections incredibly quickly that can be used to build out the SOFTBOT messaging as well as improving between internal and external models."
02 **UI Accessibility** Limited visibility and narrow journal blocks hindered user efficiency.	"Getting from nothing to a simple published working workflow is a breeze."
03 **Knowledge Gaps** A lack of accessible documentation increased onboarding time and error rates.	"Very few big is also odd too... it's just exceptions rather than error message... I've got tired of hunting."

Competitive Analysis

Benchmarking Excellence in Warehouse Automation

To ensure the SOFTBOT Designer's enhancements were market-leading, a competitive analysis was conducted. The analysis compared SAP Robotics' solutions against key players such as Fetch Robotics, Locus Robotics, and Ike Robotics. Key findings included:

Company	Description	Strengths	Weaknesses
Fetch Robotics	Pioneer of On-Demand Automation, offering flexible AMRs with high mobility and ease for customers' warehouse logistics.	Advanced autonomous mobile robots; extensive cloud robot integration.	Limited customization options for user workflows.
Locus Robotics	Innovative and award-winning multi-bot picking system.	Award-winning multi-bot picking system; robust user interface.	Higher costs and extensive hardware requirements.
Ike Robotics	Autonomous case handling robotic system designed for SAP EWM, Oracle, Infoor, Infoday systems, automating the movement of pallets and cartons.	Comprehensive SAP EWM integration; modular design for flexibility.	Steep learning curve for non-technical users.
Paperless Robotics	Builds a data-driven intelligent picking platform solutions.	Intelligent picking platform; multilingual picking interface.	Lacks support for large-scale multi-user workflows.

User Persona

Understanding Our Key Users

To better understand our users, detailed user personas were created, targeting our primary audience. The analysis compared SAP Robotics' solutions against key players such as Fetch Robotics, Locus Robotics, and Ike Robotics.

Research Findings

Themes That Shaped the Design

01 **Testing & Debugging**
Users needed a faster and more precise way to identify and resolve errors.

02 **UI Accessibility**
Enhancements to journal block sizes and visual clarity were critical.

03 **Knowledge Base**
The creation and integration of best practices and tutorials was essential for onboarding and troubleshooting.

The Proposed Solution

User-Centered Design Meets Technical Innovation

The transformation, following rigorous UX research, encompassing one-on-one interviews with users from the development and service teams. Feedback was synthesized to identify recurring pain points, prioritize improvements, and inform design iterations. The approach led to targeted enhancements:

01
Debugging Optimization
Streamlined debugging tools and redesigned execution logs for clarity and relevance.

02
Dashboard UI Improvements
Enhanced journal block visibility and introduced better visual cues for errors.

03
Knowledge Accessibility
Developed a comprehensive knowledge base and user guide to reduce onboarding time.

04
Streamlined Processes
Implemented pre-defined workflows and automatic error-log assignment to simplify common tasks.

Wireframing and Prototyping

From Vision to Validation

Wireframes and prototypes were developed to test proposed solutions with users. Iterative feedback cycles refined features such as:

- Redesigned execution logs with clearer labels and filters.
- Expanded journal block dimensions for improved readability.
- Interactive guides embedded within the platform to assist users in real-time.

Some Final Dashboard Screens

Conclusion

A Platform Transformed

The SOFTBOT Designer's enhancements resulted in measurable improvements:

30%	25%	++
Efficiency Gains	**Higher Satisfaction**	**Scalability**
Users reported a 30% reduction in time required to build connectors.	An increase in consultation hours per within the first 3 months.	The platform achieved its goal of enabling 400 connectors.
